1. OUTLINE OF THE INVENTION
The invention relates to a receiver for simultaneous
transmission and reception of digital signals and received with common
antennas. It is intended for use in mobile telephones.
2. BRIEF DESCRIPTION OF THE PRIOR ART
In prior art there are known various mobile telephone systems,
which have a transmitter and a receiver with a common antenna,
but they do not have a receiver for simultaneous transmission and reception. Formulas
for calculating the power of the transmitted signal and the power of the transmitted signal
are given. There is also given the effect of the input signal to the
receiver and the effect of the output signal transmitted are given.
Details of the device under consideration and some
technical features are given in the Polish Technical Abstract.

TITLE: Equipment for automatic measurement of antenna characteristics
radiograph model PIT-2270-60

PERIODICAL: Przegląd Telekomunikacyjny, no. 1, 1961, 33-34

TEXT: The article describes the PIT-2270-60 radiograph produced by the Zakład Doświadczalny przy Przemysłowym Instytut Telekomunikacji (Experimental Department at the Institute of Telecommunication). The radiograph automatically registers the characteristics of microwave directional antennas. The measurement dynamic is limited to about 20 dB, when measurements are made without the aid of a radiograph. With the aid of the PIT-2270-60 radiograph, the measurement dynamic is 50-60 dB and time required for measurements is cut down to only a few minutes. The radiograph is a narrow-band received, directly amplified, and operates on 1,000 cps frequency. The 1,000 cps signal received from the radio frequency detector is fed into a pre-amplifier from which it is fed into the resistance arrangement of a regulating potentiometer. In order to decrease humming and other noises, the signal is fed into a narrow-band amplifier, which narrows the

Equipment for automatic measurement ...

band to $f = 20$ cps. After further amplification the signal is rectified and applied to the steering grid of one of the two tubes of the DC amplifier, operating in opposite directions. The steering voltage of the second tube is fed from the anode of the first tube through a resistance separator. The voltage is selected in such a way that speed and direction of the recorder tip are constant regardless of the magnitude of signals and writing direction. The recorder tip is connected to both anodes of the end tubes and is located in the magnetic field created by two electromagnets. The servo-mechanical link transmits angular data from the tripod to the tape shifting box. Voltage fed from transmitting selsyns is shifted to control selsyns, turning them at the same time in the direction faced by the tripod. Simultaneously, the pressure through transformer selsyns is shifted to two (narrow and wide) channels of the servo-mechanism amplifier. The resulting pressure from the two channels is amplified and transmitted to the servo-motor. The motor activates the tape shifting box and the rotors of the transformer selsyns to the position taken up by the rotors of the transmitting selsyns. Technical data: a) band of microwave frequency = arbitrary; b) measurement dynamic when using detector with square characteristics = 30 dB. c) sensitivity = 50 v; d) decibel scale = 1 dB - 5 mm; e) accuracy of the decibel scale = ± 0.15 dB; f) angle scale = $1^{\circ} - 2; 5; 20$ mm; g) registration

accuracy of angular data $\pm 0.05^\circ$; h) maximum rotation speed of tripod = 1 revolution per 5 min; i) maximum recording speed = 10 dB/sec; j) useful width of paper tape = 150 mm; k) dimensions = about 1410 x 720 x 650 mm; l) total weight = about 240 kg.

zapalenie opon mózgowych leczone streptomycyna Chronic tuberculous
meningitis treated with streptomycin Gruzlica, Warsaw 1949, 17/3-4 (274-
293) Tables 3

Among the clinical signs the 'frog-position' is described, which the author
observed especially in young children in a late stage of the disease; the
children lie on their back with their lower limbs in strong flexion at
the hips and knee joints. It is reminiscent of the position assumed by
children with congenital dislocation of the hip. This sign was observed
in serious cases. Of 102 patients 65 died, 9 recovered (they were
followed up for more than a year); 28 remained still under observation.

EXCERPTA MEDICA Sec. 7 Vol. 9/9 Sept. 55
CZYZEWSKA, J.

1921. CZYZEWSKA J. 1. Klin. ped. Akad. med., Wrocław. *Wyniki leczenia
różnymi metodami gruźliczego zapalenia opon mózgowo-rdzeniowych u
dzieci w latach 1948-1953. Results of different regimens of
treatment in tuberculous meningitis in children during
1948-1953. GRUŹLICA 1954, 22/8 (539-546) Graphs 4 Tables 1
272 cases were treated between 1948 and 1953. Of these, 118 were cured. The
percentages of cured cases differed from year to year; they are related to the
age of the patients, their condition on admission to the hospital, and the regimen
of treatment. The best results were obtained with the following regimen: INH both
orally and intrathecally, and streptomycin i.m.; this regimen resulted in 67%
recoveries, the duration of treatment being shorter, the clinical symptoms sub-
siding and CSF clearing promptly. Relapses, however, were observed more fre-
quently than with other regimens of treatment. They were, however, mild, and
they responded well to the repeated treatment. Various clinical symptoms were
observed in the course of the disease, such as: disturbances of the hypothalamo-
pituitary system, leapfrog position, etc. These symptoms were more frequently
observed with previous methods of treatment. In the meningitis treated with INH
orally and intrathecally, combined with streptomycin i.m., these symptoms ap-
peared but rarely. Hydrocephalus developed as a relatively frequent complication
in treated cases. It could be diagnosed on clinical symptoms, CSF findings and
encephalography. In several cases encephalography performed for diagnostic pur-
poses resulted in regression of clinical symptoms of hydrocephalus; this could be
explained by the rupture of recent adhesions by air introduced into the cranioverte-
bral canal. In cured cases, the examinations of mental development were carried
out; they showed that in the first period after treatment, the mental development
of the child corresponds to that previous to illness; in the later years, however,
it reaches the level corresponding to the age of the child. Author (XX, 7, 8, 15)

"Vitamin C Level in the Blood and Urine of Children during the Course of Infectious Diseases."

Warsaw, Przeglad Epidemiologiczny, Vol 19, No 2, 1965; pp 175-176.

Abstract: Study of vitamin C levels in sera and urine of 85 healthy children and of 106 children with various infectious diseases, with a total of 608 determinations--at the beginning, during, and at the end of the disease (7-day intervals). There was a trend for vitamin C levels to fall progressively in the more severe cases, and to increase during the course of the disease in lighter cases; in severe cases there was also a frequently noted fall in hemoglobin. Specific data are given on trends in infectious hepatitis, tuberculosis, measles, pertussis, and diphtheria. Presented at the 3rd Scientific Assembly of Polish Epidemiologists and Infectologists, Krakow, 5-6 Oct 64.

2095. CZYZEWSKI K., DOLATA W. and ROSOWSKI F. Kat. I Chir. A. M., Wrocław. Wskazania do hipotermii z blokada wegetatywna *Indications for hypothermia with vegetative blockage* Pol. Przegl. chir. 1956, 28/8 (879—881) Tables 1

Hypothermia is indicated under the following conditions: Acute: initial shock, traumatic shock, ileus and peritonitis. Chronic: seriously damaged internal equilibrium of the body, operations suggesting a possibility of damaging this equilibrium, i.e. long-term operations, impairment of oxidation, excitation of the vegetative plexus and a possibility of massive haemorrhage.

EXCERPTA MEDICA Sec.9 Vol.12/3 February April 1958

**2297. PHYSIOPATHOLOGICAL BASES OF SURGICAL TREATMENT OF LIVER
CIRRHOSIS WITH THE LIGATION OF ARTERIES - Fizjopatologiczne
podstawy chirurgicznego leczenia marności wątroby podwiązywaniem
tętnic - Czyżewski K., Falkiewicz A. and Rosowski F.
Klin. A.M., Wrocław - POL. ARCH. MED. WEWNĘT. 1957, 27/1 (1-14)
Tables 3 Illus. 6**

The surgical methods of treatment of liver cirrhosis are surveyed. Five cases from the authors' own material are quoted. The ligation of hepatic arteries - with or without splenectomy - was performed with fatal outcome in all cases. In the authors' opinion it is nevertheless a promising operation and should be tried under new and improved circumstances. Gibiński - Bytom (XVIII, 9)

EXCERPTA MEDICA Sec 7 Vol 13/10 Pediatrics Oct 59

"Hypotensive Duodenography in the Diagnosis of Subacute
Pancreatitis"

Warsaw, Polski Tygodnik Lekarski, Vol XXIII, No 6, 4 Feb
1963, pp 207-210

Abstract: Authors' English summary modified/Hypotensive
duodenography was introduced into the diagnosis of pancrea-
tic diseases by the Lyon school 3 years ago. The techniques
used by the authors are described. Hypotonia of the duoda-
num was obtained by antronyl injection and introduction of
20 cc 2% solution of xylocaine into the duodenum. 54 hypo-
tensive duodenographies were performed, 23 of them in di-
seases of the pancreas.

"Long-Term Results of Treatment of Exophthalmic Goitre by Thiourea Derivatives and by Operation in the Wroclaw Clinic."

Warsaw-Krakow, Przeglad Lekarski, Vol 19, Ser II, No 3, [24 Mar] 63, pp 179-180.

Abstract: Authors give their criteria for rating results as good, uncertain, and poor and give statistical result of follow-up (up to 12 years) on 1164 cases treated by medication and 151 treated by operation. Although percentage of good results much higher in operation cases (94.7 to 73.7 percent), the frequency of complications (also summarized statistically) call for careful consideration of the mode of treatment. Of the 9 refs., 4 are Polish, 2 each Russian and German, and one is French.
